

Extreme Precipitation

Historical Trends, Future Changes, & Potential Impacts

Overview

- Historical trends & future projections
 - Seasonal precipitation
 - Precipitation intensity
 - Snowfall intensity
 - Drought

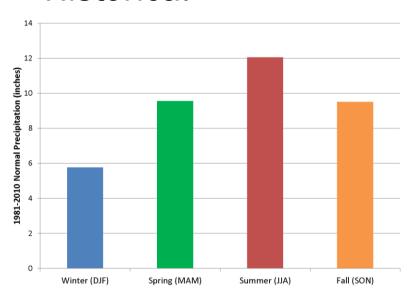

Potential impacts from expected changes

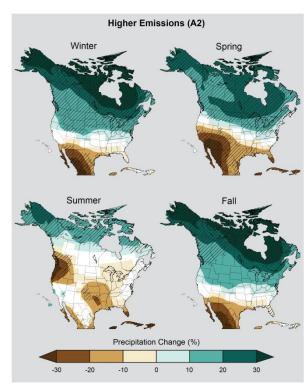

Seasonal Precipitation

Historical

1981-2010 precipitation normals by season (Chicago O'Hare Airport)

Future

Projected percent change by season for 2071-2099 (compared to 1971-1999) (NCA 2014)

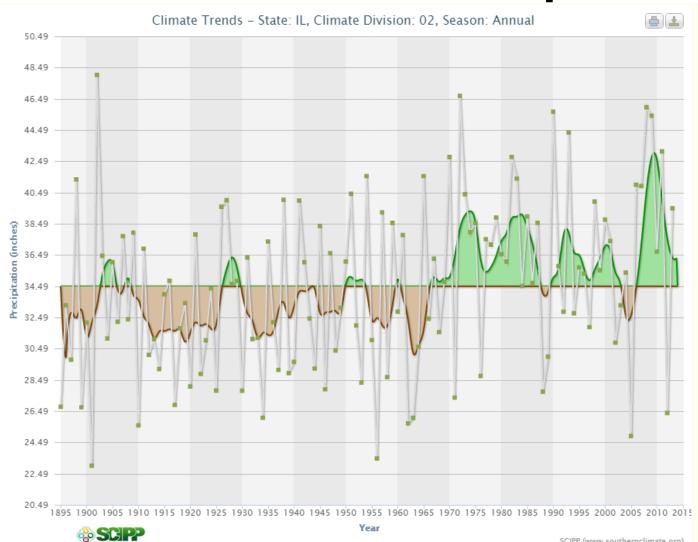

NE Illinois Annual Precipitation

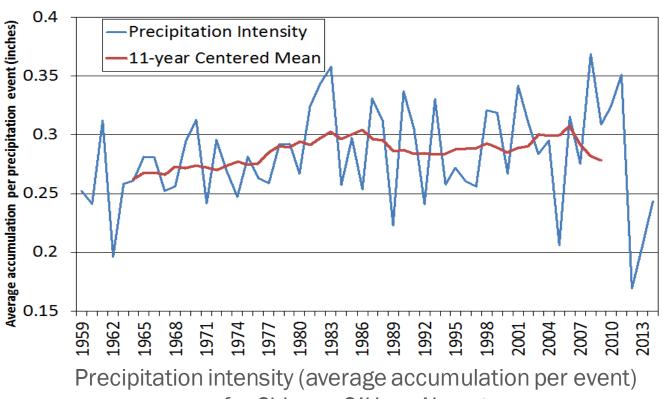

SCIPP (www.southernclimate.org)

Precipitation Intensity: Historical

Precipitation Intensity Chicago O'Hare

for Chicago O'Hare Airport

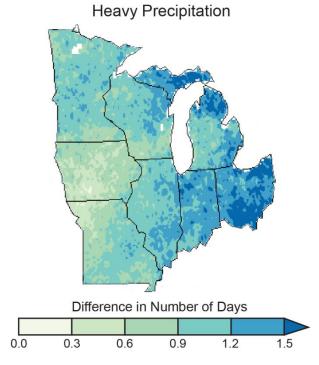

Precipitation Intensity: Future

 Increases in frequency and intensity of extreme precipitation expected

Chicago

Heavy precipitation days: +0.9-1.5 days per year

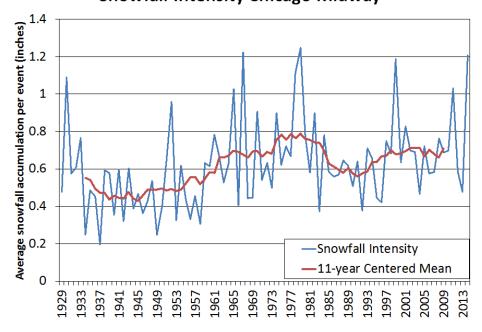

Increase in number of days with very heavy precipitation (top 2% of rainfalls) in 2071-2099 (compared to 1971-2000) (NCA 2014)

Snowfall Intensity

• Historical
Snowfall Intensity Chicago Midway

Snowfall intensity (average snow accumulation per event) at Chicago Midway
Airport since 1929

Future

Increased winter
 precipitation could
 mean greater chances
 for both heavy snowfall
 and rainfall events
 (Hayhoe et al. 2010).

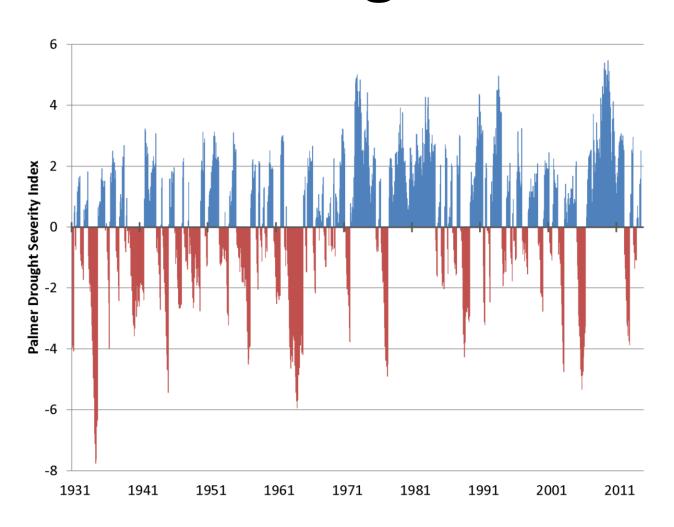

Drought: Historical

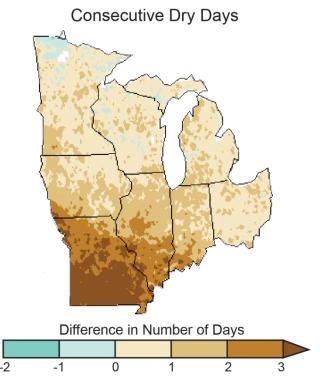

Palmer Drought Severity Index

Northeast Illinois (Climate Division 2)

Drought: red Non-drought: blue

Drought: Future

Change in average maximum number of consecutive days each year with no precipitation in 2071-2099 (compared to 1971-2000) (NCA 2014)

- Both floods and droughts expected increase in frequency in the future in the Midwest (2014 NCA)
- Longer periods of dry conditions

Impacts: Seasonal Shift

Summer decrease

Increased agricultural drought issues

Spring increase

Increased river flooding risk (combined with seasonal snowmelt)

Winterincrease

- Increase flood and heavy snowfall risk
- Increased runoff issues with rain falling on snow/frozen ground

\$1 Billion Disaster in 2013

 On April 7-11, 2013, a slow-moving storm system created rainfall totals of 5 to 10 inches across northern and central Illinois including the Chicago metro. This resulted in damage to many homes and businesses. There was also severe weather damage from wind and hail across Indiana and Missouri.

Impacts: Higher Intensity Rainfall

2014 National Climate Assessment Key Message 5 for the Midwest

Increased Rainfall and Flooding
Extreme rainfall events and flooding have increased during the last century, and these trends are expected to continue, causing erosion, declining water quality, and negative impacts on transportation, agriculture, human health, and infrastructure.

Impacts: Higher Intensity Rainfall

Increased flood risk

Expansion of urban areas (impervious surfaces) exacerbate impacts

Water quality issues

- More non-point pollution
- More combined sewer overflows/lake reversals
 - 120% increase in CSO's into Lake Michigan by 2100 (2014 NCA)

Update Bulletin 70

- Design standard since the 1980s.
- Defines things like the 10-year and 100-year storm.
- Better to think of the 100-year storm as having a 1% chance of occurring in any year.
- The challenge is in anticipating future climate change.

Impacts: Higher Intensity Snowfall

* Winter adaptation handout with policy recommendations in folder*

- Increased risk for winter power blackouts
- Increased risk for falling trees and branches
- Transportation issues

Impacts: Drought

- Increased stress/regulations for municipalities reliant on ground water
- Stress on municipal infrastructure
 - E.g. pipe issues
- Increased stress to agriculture/urban green space
 - More irrigation needed?
